

MINISTRY OF TRANSPORT

BULGARIAN MARITIME ADMINISTRATION

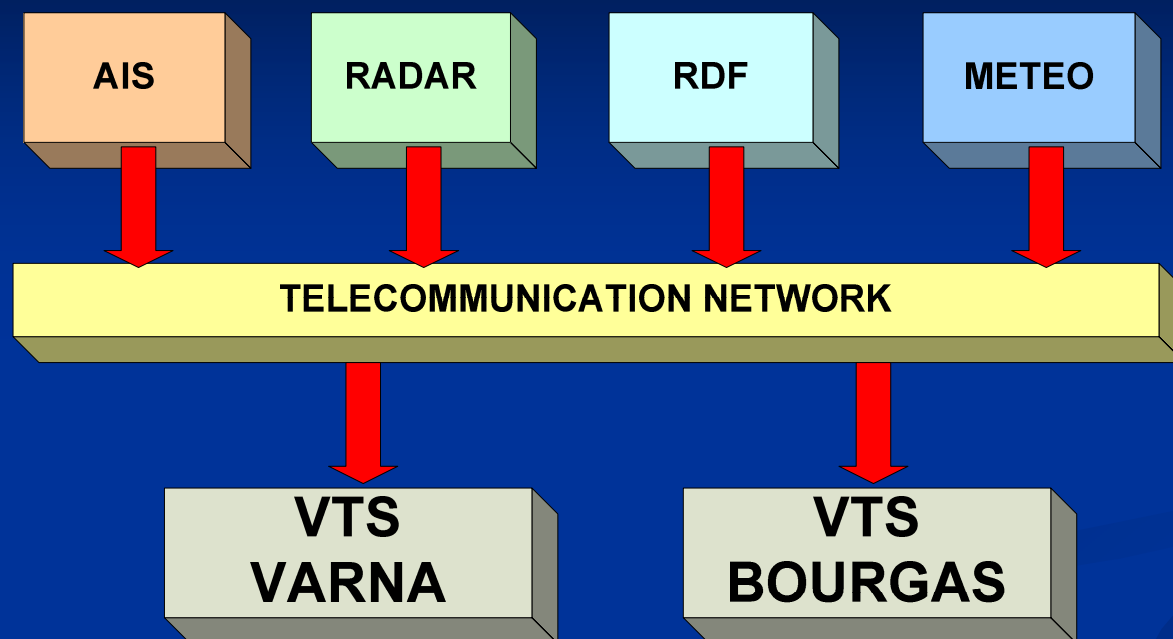

Bulgarian participation in
Mediterranean AIS network
and proposal for implementation of
Black Sea AIS network

Odessa 24-26 June 2008

BULGARIA IN EUROPEAN MARITIME SAFETY CONCEPT

Bulgarian VTMISS subsystems

VTMISS includes the following subsystems:

AIS (Automated Identification System) – 6 base stations

RADAR (Radar surveillance) – 9 Radars

RDF (Radio Direction Finder) – 6 stations

METEO (Meteorological sensors) – 2 stations (Varna and Bourgas)

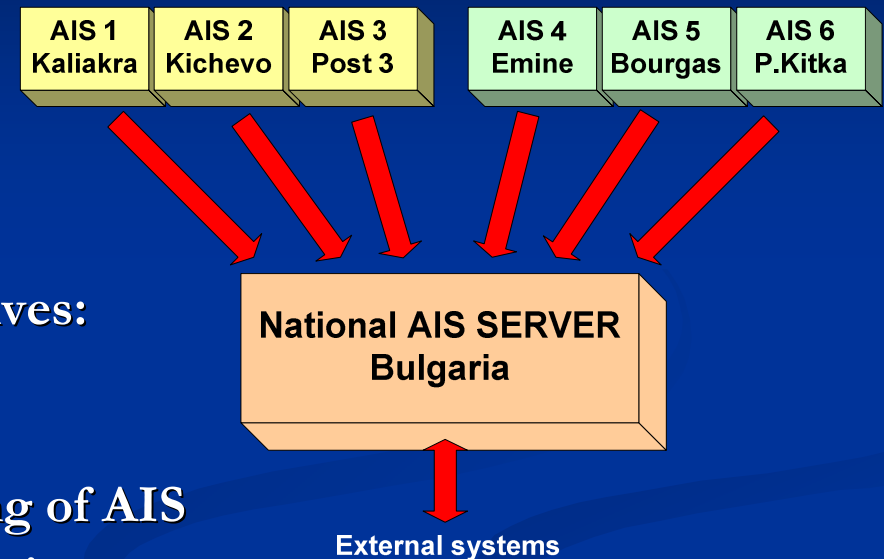

All sensors are connected to the VTS centers Varna and Bourgas via the microwave telecommunication network

Main objectives

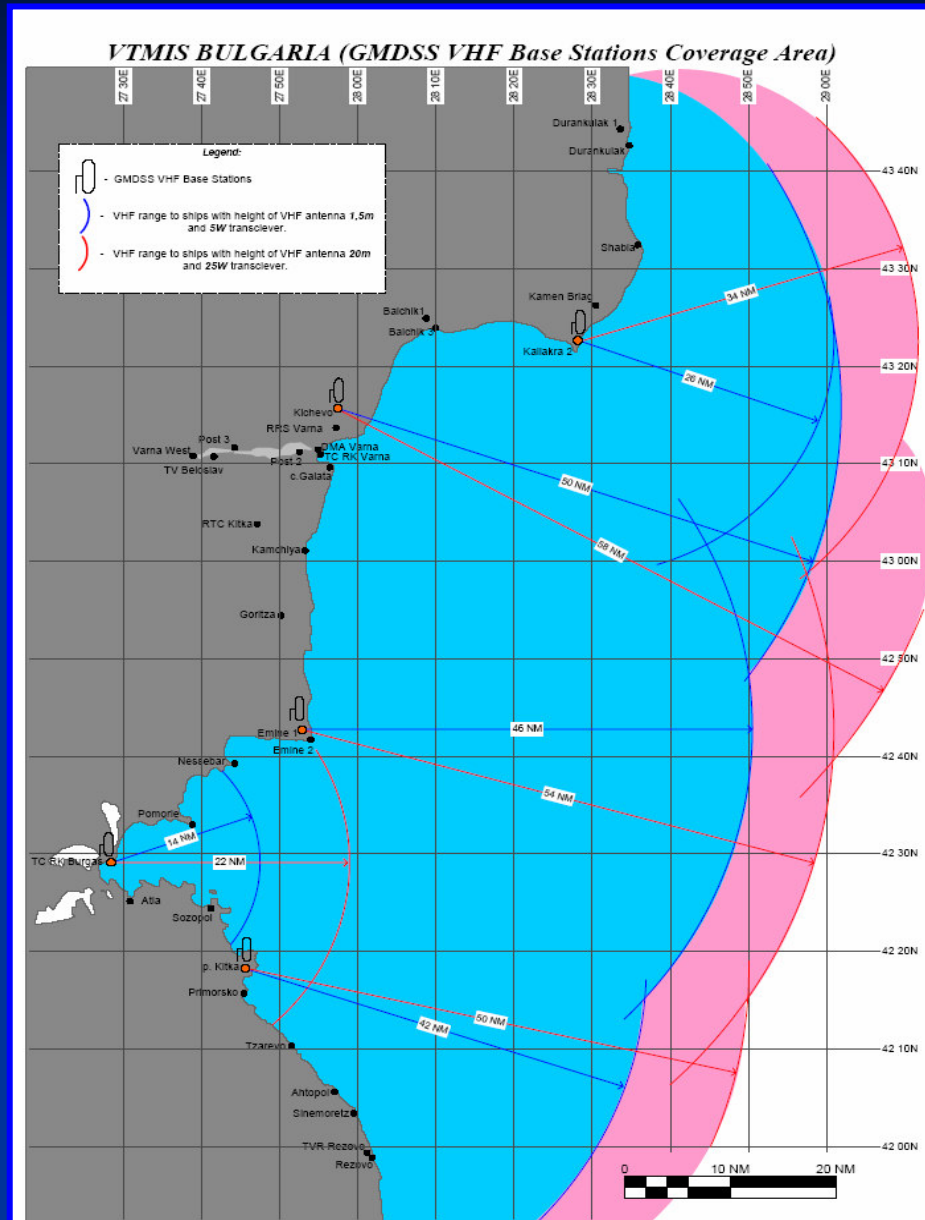

The development and implementation of Bulgarian National AIS server was completed in November, 2007.

The system has the following main objectives:

- Centralization, processing and archiving of AIS information acquired from AIS base stations
- Exchange of AIS data with EU SRIT/STIRES system
- Exchange of AIS data with Mediterranean AIS system
- Future exchange of AIS data with other Black Sea countries

Bulgarian AIS network – coverage area

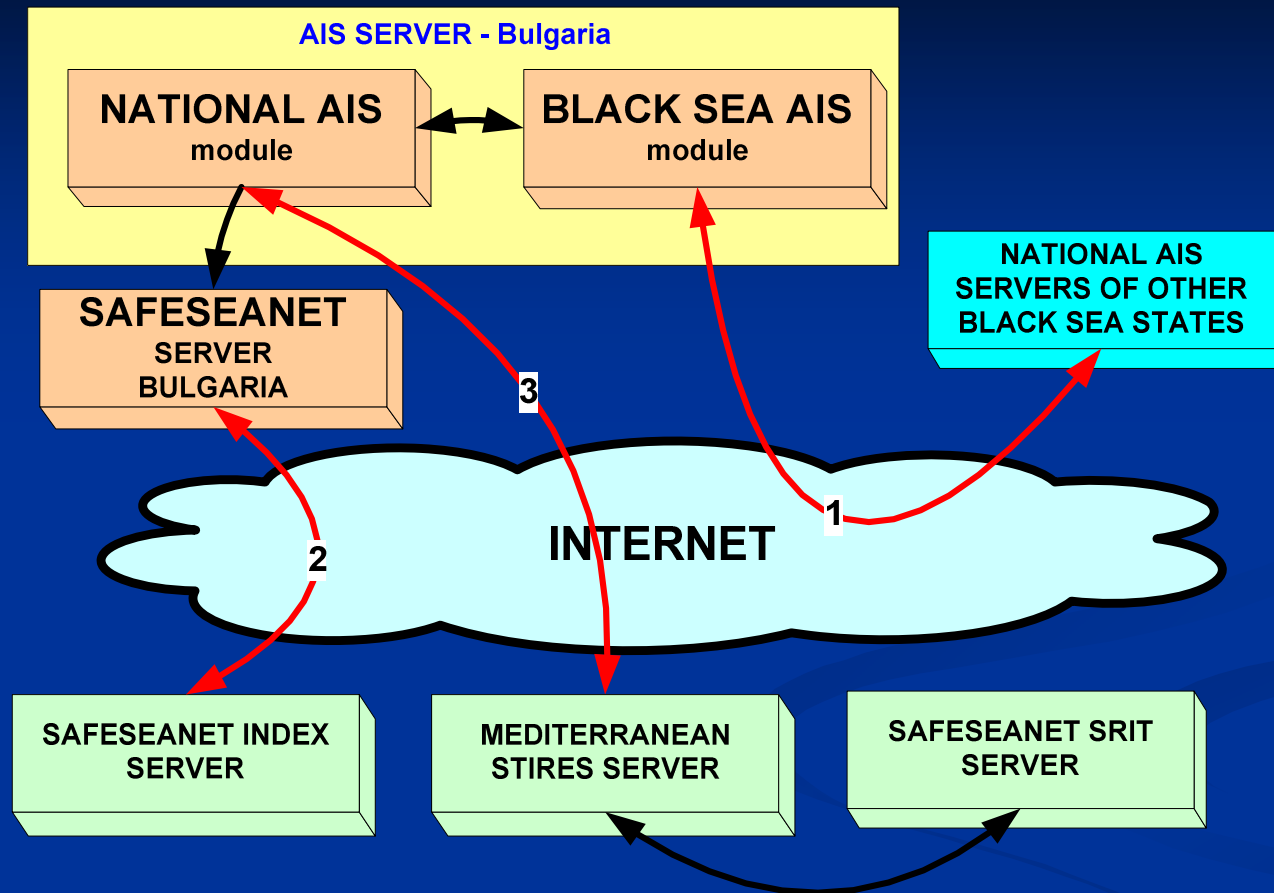

➤ Bulgarian AIS network consists of **six AIS base stations**.

➤ The system provides **full coverage of the coast** since October 2004.

➤ All AIS base stations are connected to the VTS servers via **MCL telecommunication network**

Data exchange concept diagram

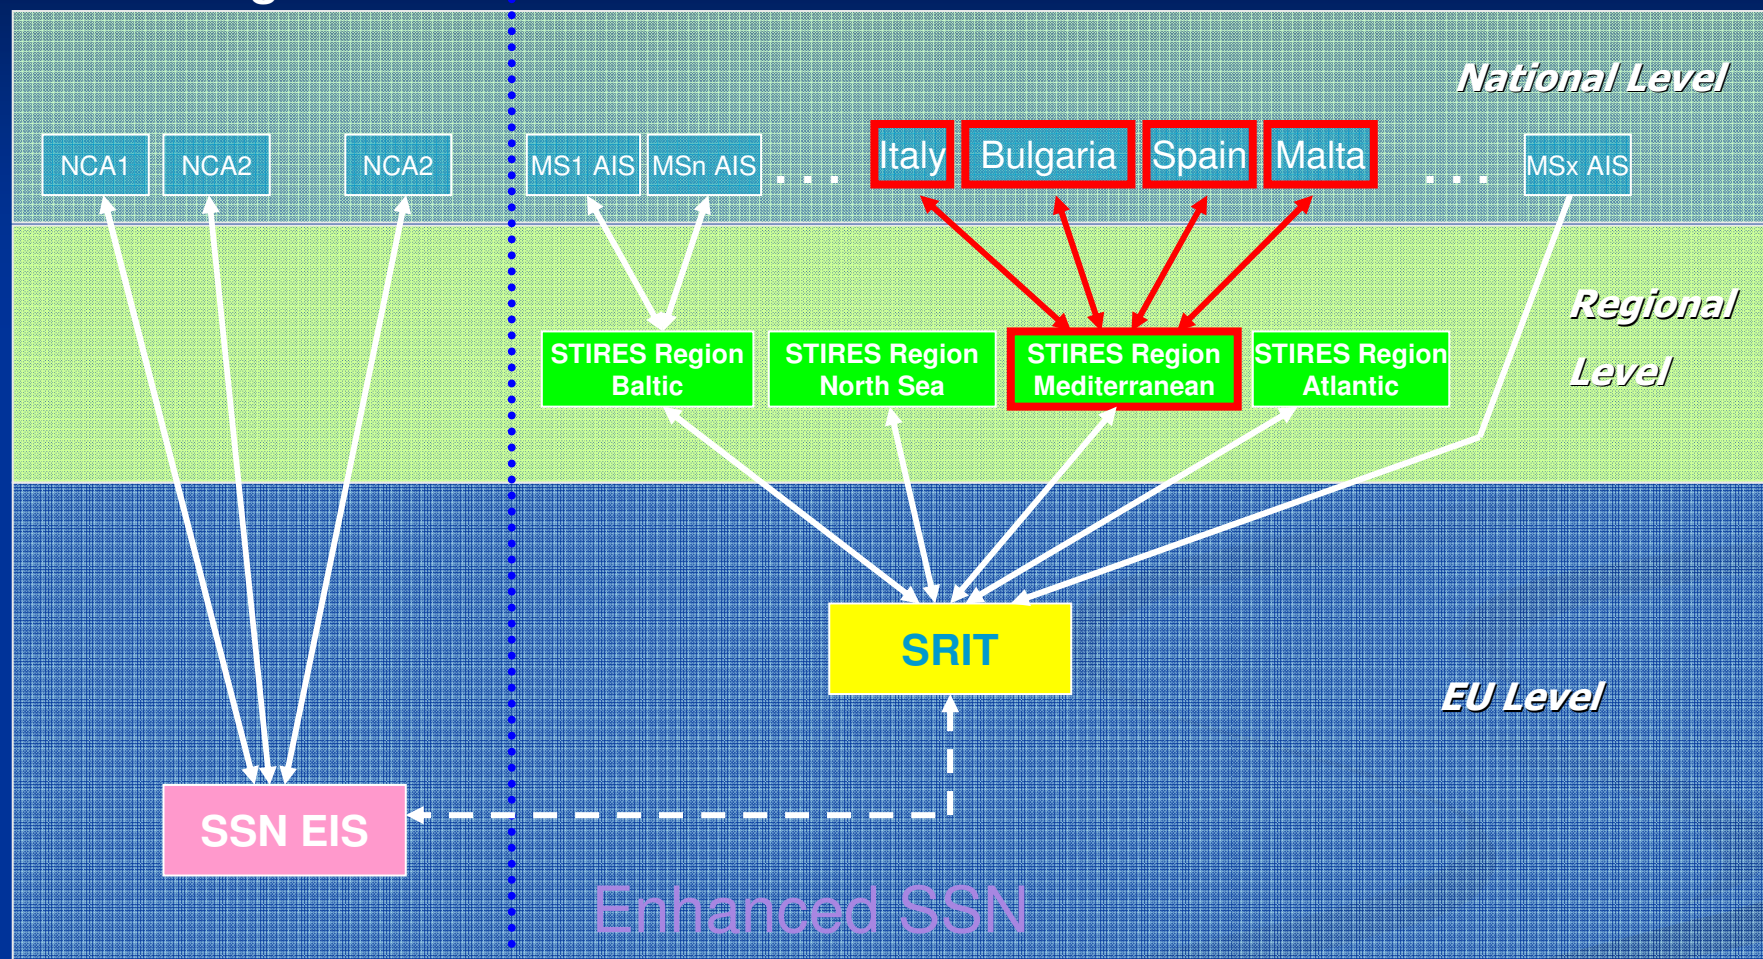

1. Exchange of AIS data between Bulgaria and **other Black sea countries**
2. Generation of **ship notifications to SafeSeaNet**
3. Exchange of AIS data with the **Mediterranean STIRES server**

Mediterranean AIS network

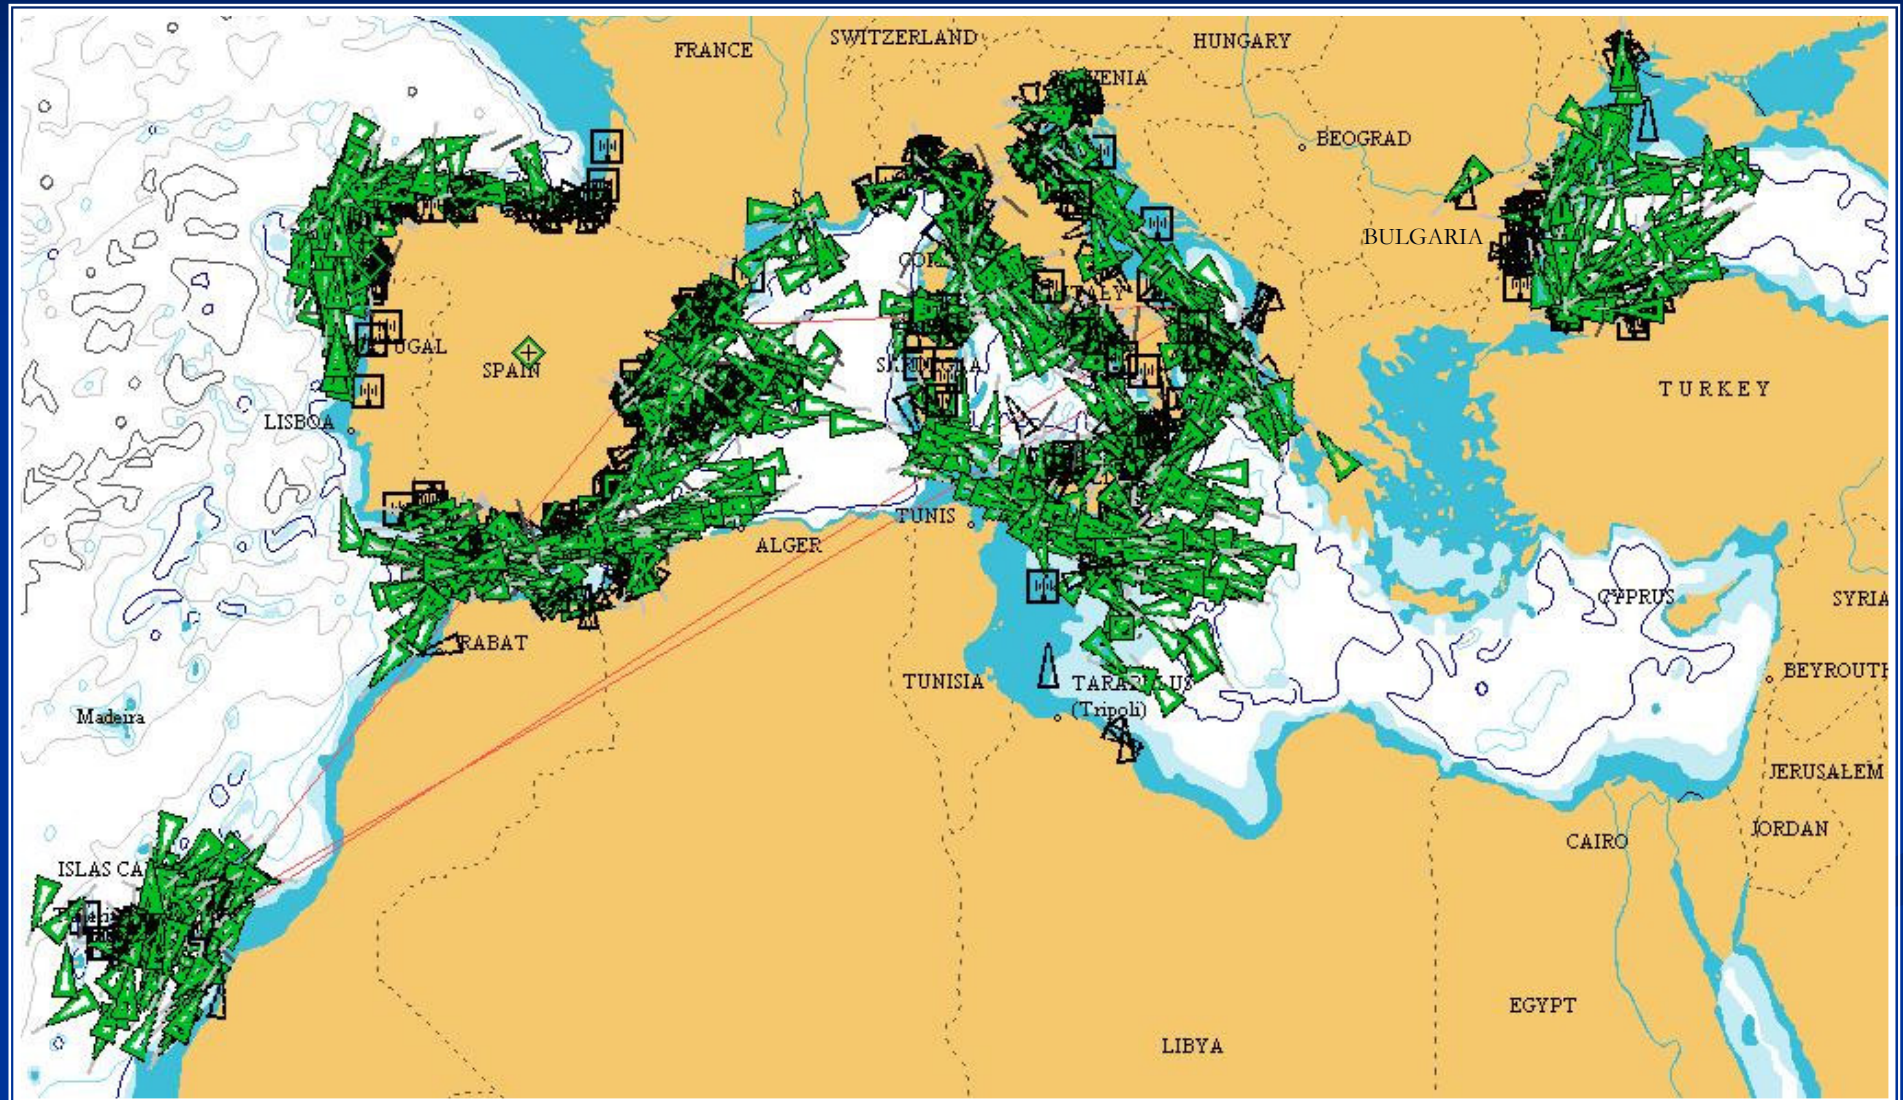

- With the help of the National AIS server Bulgaria is currently exchanging AIS data with the Mediterranean AIS server which is part of the STIRES concept.
- STIRES is the common European Union “Short Range Identification and Tracking” approach to the requirements of Directive 2002/59/EC;
- STIRES AIS data from EU member states will be integrated with SafeSeaNet giving exciting new monitoring possibilities;
- Italy, Bulgaria, Spain and Malta are participating in the test exchange of AIS data within the Mediterranean STIRES module.

Med AIS network

Bulgarian proposal for AIS data exchange based on bilateral agreements

Benefits from the exchange of AIS data between Black Sea countries

- Increased safety of navigation;
- Increased efficiency of joint SAR and anti-pollution activities;
- Improved organization of the ships' traffic related to the additional information received by VTS centers; and
- Improved statistics of the marine transport in the Black Sea.

AIS data exchange principles

- Voluntary participation;
- Decentralized structure – the exchange is based on bilateral agreements and peer-to-peer communication; and
- Filtering of sensitive information.

The communication between national systems is provided via Internet using encrypted VPN connections. Data format will be according to AIS specifications (IEC 61993-2, IEC 61162-1).

Thank you for your attention!
